### Screw clamping

Since the advent of the Torx screw it has been possible to hold with complete safety positive inserts with center hole. Our range covers all the screw clamping permutations.

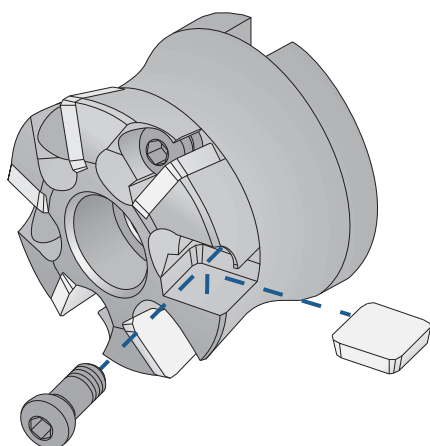

### Center screw clamping

Grinded high accuracy center screws ensures that the insert is firmly fixed. This clamping system is only used for finishing applications.

### Double clamping

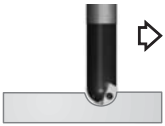

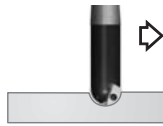

Heavy duty work require good fixation, for this purpose we have as designed our double clamping system, one of the safest available.

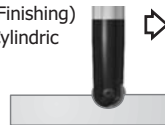

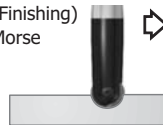

### Wedge screw

This easy and clean clamping system has been designed for the high feed cutters with flat inserts. The wedge screw clamping system offers good chip evacuation and easy use.

Profile milling

**Characteristics:**

Indexable ball nose roughing cutter equipped with positive insert that provides low cutting forces and reduced vibration. Its accurate pocket ensures that the insert is firmly fixed. The insert is fixed by Torx screw that allow a good chip evacuation and easy use. Milling cutter equipped with cylindrical shank.

**Applications:**

Ball end mill roughing applications for tool and die. This indexable ball nose cutter works well on steels, hardened steels, stainless steels and casts.

		Vc=220m/min ap=0,5mm ae=0,3D								1430

Note

- The cutting data in the table show conditions for VB30=0,3mm (flank wear 30min tool-life).  
Overhang is the length below the chuck (l b)

- RPM for high-speed machines is calculated using the following formula:  $Revolution\ Speed = \frac{500 \times Actual\ Maximum\ Cutting\ Speed}{\pi \times \sqrt{2} \times R \times ap-ap^2}$

- Actual Maximum Cutting Speed:  
ap=0,5mm and 1mm  
Maximum Cutting Speed at boundary of contact part with work material under the above recommended cutting condition

- Cutting conditions on high-speed machine tools are recommended for contouring path milling.

- 3-5° slant milling is recommended for pocketing using a 70% feed rate, please reduce slant angle below 3° for harder materials. Please use machine guards when cutting steel due to flying chips.

### Deep Side Milling

Material	m/min Cutting Speed	mm/tooth Feed rate	Ø20		Ø25		Ø30		Ø40

### Characteristics:

Indexable ball nose mirror finishing cutter equipped with positive insert that provides low cutting forces and reduced vibration. Its accurate pocket ensures that the insert is firmly fixed.

Milling cutter equipped with Morse shank.

### Applications:

Ball end mill for tool and die applications. This indexable ball nose cutter works well on steels, hardened steels, stainless steels and casts.

**Note**

- According to the machining situation, refer to the table above to determine the cutting conditions.
- Be sure to practice safety instructions and precautions such as wearing glasses and safety shoes, and placing safety covers when you use this tool. Because this tool can be broken during machining so failure to follow these instructions may cause personal injury.
- Never attempt to modify the carbide shank holder. Use the value for the depth of cut (ap) when the carbide shank holder is used.  
 Mill diameters D=8~12mm:ap<=0,2mm.  
 Mill diameters D=16~32mm:ap<=0,3mm.

$$n = \frac{V_c \cdot 1000}{\pi \cdot \text{Def.}} \quad (\text{Rev./min.})$$

N = Spindle speed (Rev./min.)

Vc = Cutting speed

Def. = Effective cutting diameter

ap = Max. Depth of cut (mm)

Face milling cutters

Square shoulder cutters

Slot cutters

Porcupine cutters

Specific applications and Sets

Profile milling

**Characteristics:**

High feed square insert cutters for peripheral milling ramp milling and drilling, pocket milling and copy milling. Precision type inserts are available for efficient machining in most materials.

**Applications:**

This copying, milling cutter works well on hard steels, alloyed steels, stainless steels, refractory casts and aluminium alloys. A general milling cutter for diversified manufacture that allows using it in only one pass (roughing and finishing) and it is recommended for machining centers.

Profile milling

**Characteristics:**

High feed positive milling cutter with 15° entering angle. Its strong inserts accept high feed per teeth. The original fixing system from Canela allows a quick insert assembly and dismantling.

**Applications:**

This face milling cutter works well on steels, stainless steel, alloyed steels, cast iron and aluminium alloys. This general purpose milling cutter is recommended for C.N.C. machines.

## Processing by direct milling is also possible

Since the cutting flute do not extend to the center, there are limitations on the ramp angle and hole diameter, but as shown below, processing by direct milling without a pilot hole is possible for ramping and helical milling.

**Ramping**

**Helical milling**

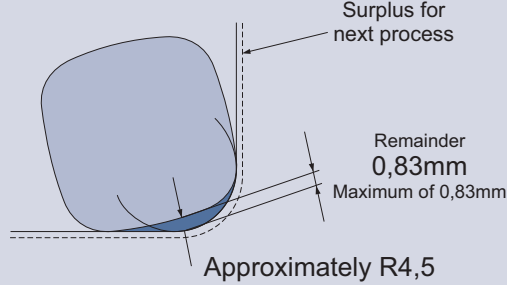

Tool diameter	Ø32	Ø40	Ø50	Ø63	Ø80	Ø100
Maximum ramp angle $\alpha$	7°	4,5°	3°	1,7°	1°	1°
Hole diameter	Ø44-61	Ø61-76	Ø80-96	Ø107-122	Ø142-156	Ø179-195

Note -The ramp angle  $\alpha$  should be set within the ranges listed above. Use at ramp angles of 1° or less recommended.  
 -For hole diameters outside the ranges listed above, a pilot hole should be drilled before milling.

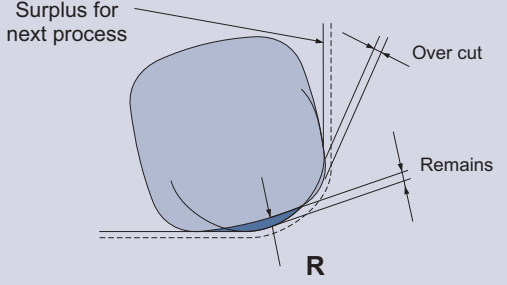

## Method for defining conditions of insert tip programmatically

For roughing processing, please create a program with corner R values close to those shown as references below.

**When corner R is set to 4,5**

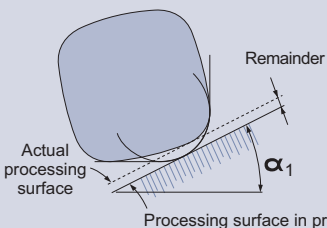

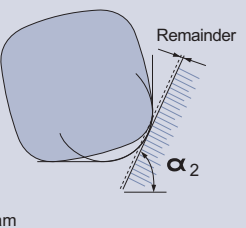

**When corner R is set larger**

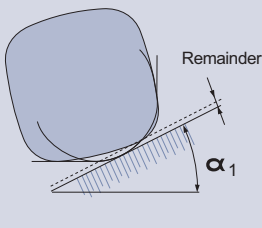

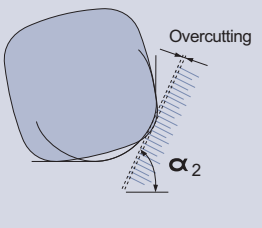

Normally, you should create a program with an input corner R of approximately 4,5. At an approximate input corner R of 4,5, there is no overcutting.

Although overcutting occurs when the approximate R is set to higher values, if the overcutting is within the surplus for the next process, there is no problem with the processing shape and the amount of remainder can be suppressed.

Approximate input corner R	R4,5	R5,1	R5,5	R5,8	R6,1	R6,4
Remainder	0,83 $\alpha_1=22,1^\circ$	0,66 $(\alpha_1=20,3^\circ)$	0,55 $(\alpha_1=19^\circ)$	0,47 $(\alpha_1=17,9^\circ)$	0,39 $(\alpha_1=16,7^\circ)$	0,32 $(\alpha_1=15,4^\circ)$
Overcutting	-	0,1 $(\alpha_2=73,4^\circ)$	0,2 $(\alpha_2=67,7^\circ)$	0,3 $(\alpha_2=64,7^\circ)$	0,4 $(\alpha_2=62,3^\circ)$	0,5 $(\alpha_2=60,5^\circ)$

Note  
 - Overcutting and remainder vary according to the processing shape. The values in the table above are maximum values.  
 - The values of  $\alpha$  shown are the slopes of the processing surfaces when overcutting and remainder are at their maximum respective values.

**For example, when a program is created with an approximate R of 5,1:**  
 Remainder of around 0,66mm is left when the slope of the processing surface is approximately 20,3°, and when the slope of the processing surface is approximately 73,4°, about 0,1mm of overcutting occurs. At areas with other slopes, the overcutting and remainder values are below these values.

Note

- Select the best cutting condition when working, referring to above list.  
(If the overhang is 3D or less, the recommended cutting speed is  
Vc=180-200m/min; 3D or more: Vc=90-130m/min.)

- Thick and heavy chips are generated by using this tool. Be sure to remove them with air blow in order to avoid any breakage by blocking with chips.

The recommended method is "Spindle center through" when blowing air. (Pay attention when removing chips in cavity work with the machining center <vertical type>.)

Inserts

Face milling cutters

Square shoulder cutters

Slot cutters

Porcupine cutters

Specific applications and Sets

Profile milling

### Characteristics:

Round insert end mills for slot milling, peripheral milling, ramp milling and drilling, pocket milling and copy milling. Precision type inserts are available for efficient machining in most materials. Milling cutter equipped with cylindrical shank.

### Applications:

This copying milling cutter works well on hard steels, alloyed steels, stainless steels, refractory casts and aluminium alloys. A general milling cutter for diversified manufacture that allows using it in only one pass (roughing and finishing) and it is recommended for conventional milling machines and machining centers.

Note

-In this table, cutting conditions indicate regular type conditions for frank wear to be 0,3mm in 30 minutes.

-The following formula shows the chip removal volume (Q) per unit time.

$$Q(\text{cm}^3/\text{min}) = a_p(\text{mm}) \times a_e(\text{mm}) \times V_f(\text{mm}/\text{min}) / 1000$$

-In the case of slotting, feed speed could be down to 70% of the whole.

-This table shows starting points of general cutting conditions. Please adjust according to rigidity of machine tools, tooling, conditions of work-pieces and so on.

-In steel exceeding 60HRC, such as dice steel between the colds, please set the sending (fz) value per one edge about 1/2.

## Field Data

### Ramping, Helical Milling, Feeding toward Z-AXIS

There are restrictions to Ramp angle ( $\alpha$ ) and cutting depth (g) toward Z-axis because of designs of cutting edge.

Ramping

Helical milling

ØD	Ø40	Ø50 - Ø52	Ø63 - Ø66	Ø80	Ø100	Ø125 - Ø160
Recommended $\alpha$	Below 3 degrees					Below 2 degrees
h	2,5	2,5	2,5	2,5	2,5	2,5
g	3,7	3,3	5,5	5,5	5,5	5,5
Helical hole diameter	60-78	77-100	101-124	135-158	175-198	248-255

Note

-Chips may be shattered. The wearing of safety glasses and the guard are required in the vicinity of machining.

Inserts

Face milling cutters

Square shoulder cutters

Slot cutters

Porcupine cutters

Specific applications and Sets

Profile milling

Shanks page: K.45 - K.48

**Characteristics:**

General application end mills for slot milling, peripheral milling, ramp milling and drilling, pocket milling and copy milling. Precision type inserts are available for efficient machining aluminium alloys.

Milling cutter equipped with modular shank.

**Applications:**

Aluminium plastics and exotic materials machining.
